**EXTREMITIES**

Biotek is a global medical device company with a strong focus on new product development in the most advanced orthopedic sector: SPORTS MEDICINE

Biotek continues to experience unprecedented growth and demand for our products throughout the world; we currently have a presence in all six continents around the world. However, Biotek remains a privately held company with a family business culture committed to delivering uncompromising quality to the health care professionals who use our products, and ultimately, the millions of patients whose lives we impact.

**2003** Year

## OSKAR<sup>®</sup> Radial Head Prosthesis

## EXTREMITIES

Available in Standard and Extra Long stem Sizes, the OSKAR<sup>®</sup> Radial Head Implant is a one-piece monoblock intramedullary-stemmed implant designed to help preserve the joint space and relationships of the radio-humeral and proximal radio-ulnar joints following irreparable radial head or neck fracture.

### INDICATIONS

- Primary replacement after fracture of the radial head where fixation is not possible in isolation or with associated injuries
- Symptomatic sequelae after radial head resection
- The OSKAR<sup>®</sup> Radial Head Implant is available in seven sizes to adequately meet various operative requirements. A sizer set, supplied nonsterile and not suitable for implantation, is available for proper size determination during surgery.

### Ordering Information (Implants)

Sr. No.	Catalog No.	Product Description
01.	BOR-33.10	OSKAR <sup>®</sup> Radial Head Size 1.0, Extra Small, Uncemented
02.	BOR-34.15	OSKAR <sup>®</sup> Radial Head Size 1.5, Small, Uncemented
03.	BOR-35.15	OSKAR <sup>®</sup> Radial Head Size 1.5, Small Long, Cemented
04.	BOR-36.20	OSKAR <sup>®</sup> Radial Head Size 2.0, Medium, Uncemented
05.	BOR-37.25	OSKAR <sup>®</sup> Radial Head Size 2.5, Large, Uncemented
06.	BOR-38.25	OSKAR <sup>®</sup> Radial Head Size 2.5, Large Long, Cemented
07.	BOR-39.30	OSKAR <sup>®</sup> Radial Head Size 3.0, Extra Large, Uncemented

**Note:** OSKAR<sup>®</sup> implants are made of Titanium and are available in a Sterile pack.  
\* Available in India only.

Standard Stem- Variants (Uncemented)

DIMENSION (in millimeters)

Size	1.0(Ext. Small)	1.5(Small)	2.0(Medium)	2.5(Large)	3.0(Ext. Large)
A	27.50	29.00	30.50	32.00	33.50
B	9.50	10.50	11.50	12.50	13.50
C	18.00	19.00	20.00	21.00	22.00
D	6.00	6.50	7.00	7.50	8.00

Long Stem- Variants (Cemented)

DIMENSION (in millimeters)

Size	1.5(Small)	2.5(Large)
A	55.00	55.00
B	10.50	12.50
C	19.00	21.00
D	6.20	6.20

**NOTE:** The use of extra long radial head implant is indicated when there is a lack of bone stock at the radial neck and the distance between the capitellum and the proximal radius is too long for the conventional style implant. This situation can be seen when there has been a comminuted radial head fracture including the neck or following an overzealous bone removal in radial head excision procedures.

Total Elbow is indicated for primary and revision intervention, post traumatic and rheumatoid arthritis, and trauma reconstruction. For complete patient matching flexibility, the TEXX-21® Total Elbow is unsurpassed in interchangeability and design and is the total elbow of choice for its ease of use. It is backed by more than a decade of clinical success. The ease-of-operation, enhanced fixation, and simple, precise instrumentation provides excellent results.

The rationale behind the TEXX-21® Total Elbow was to create a device that replicates anatomy while providing a superior mechanism that is easier to assemble and revise. It was also a priority to create an instrument set that was ideal for a broad range of surgeons.

The device is intended for use with both the humeral and ulnar components inserted with bone cement.

Indications

The elbow replacement may be done if the patient has one or more of the following conditions:

- Bone injury or bone loss contributing to elbow instability
- Abnormal stiffness, immobility, and consolidation of the elbow joint (ankylosis)
- Painful deterioration of the elbow joint cartilage (osteoarthritis)
- Painful inflammation in the lining of the elbow joint (rheumatoid arthritis)
- Arthritis resulting from physical injury to the elbow joint (traumatic arthritis)
- Elbow joint instability or loss of motion, which cannot be satisfactorily addressed by more conservative treatment options in the elderly.
- A previous elbow joint replacement which has worn or failed.

Snap-fit Locking Pin

- Two-piece locking pin simply snaps together and provides accuracy and efficiency.
- Easy disassembly of the locking pin enhances interchangeability in revision cases.
- Allows for assembly or disassembly without compromising either epicondyle.
- Addresses individual anatomy by allowing any humeral component to be used with any ulnar component.

Enhanced Ulnar Positioning

- Anatomically designed ulnar component (for Right/Left Limb) allows for anatomic axis of motion.
- Quadrangular to match canal landscape, to help minimize intramedullary rotation in the ulna.
- Poly Bushings, with Ultra-high molecular weight polyethylene, prevents metal-to-metal contact.

Anatomic Humeral Stem

- Triangular to match landscape of canal maximizing stability and minimizing rotation.

Anterior humeral flange

- Permits insertion of bone graft anteriorly to enhance thickening of bone stock where maximum stress occurs, reducing posterior displacement and torsional forces and helping protect bone / cement / implant interface.

Trauma Reconstruction

- The longer flange option addresses clinical situations involving distal humeral bone loss without compromising elbow joint performance.

Complete Interchangeability:

- 4 Humeral Stems lengths in small, medium, large and extra-long with small size options.
- 8 Ulnar Stems - Regular and Extra-long lengths in small and large sizes.
- Provides comprehensive patient matching and introspective flexibility.

The URSA<sup>®</sup> Hemi-Shoulder Arthroplasty System designed for hemiarthroplasty of the shoulder has enjoyed more than a decade of clinical success. The variety of head sizes allow the surgeon to better recreate the normal anatomy which is so important in tensioning of the soft tissues for joint stability and providing maximum postoperative function. The modular components also allow the surgeon to better reconstruct the tuberosities in difficult acute fractures and chronic malunions of the proximal humerus. The modularity in both the implants and instruments, increase intraoperative flexibility, offering the surgeon an excellent overall system to perform hemi-arthroplasty tailored to each patient. The device is intended for use with a humeral stem inserted with bone cement.

Primary Indication:

- Acute non constructable fracture of the Proximal Hummers.

Extended Indication:

- Non-union/Malunion of Proximal Humeral Fracture
- Failed fixation of proximal humorous fracture
- RheumatoidArthritis cuff tear arthropathy where a reverse shoulder is not deemed possible.

Multiple Holes on Humeral Stem

Multiple holes allow suture reconstruction of greater tuberosity for better stability & function, and ensure accurate fit. The space inside the stem to insert the bone graft.

Humeral Head

Multiple head diameters to ensure accurate fit. Different neck lengths to allow proper joint tensioning.

Humeral Stem

A family of humeral component sizes has been designed to fit the wide range of humeral canals. Proper fit in the humeral canal aids in proper varus-valgus alignment. Proper fit in the metaphysis, combined with the collar, provides stability against subsidence. A unique system of humeral cutting and broaching instruments helps achieve optimal stem placement.
